

INTERNAL — HUMAN SKILLS

Setup & Render Guide

How to install the Human Skills plugin, connect the render providers, and run the zero-credit Spaces flow where Claude builds every prompt and you just press play.

WHAT'S INSIDE

- **Part 1** — Install the plugin in three clicks: upload one file in the Customize panel. The nine skills come inside it.
- **Part 2** — The render setup every skill uses: the three paths (Magnific MCP, Hybrid Run Unlimited, Higgsfield) and why there's no raw API key.
- **Part 3** — The Spaces flow: Claude writes the prompts and pre-fills a free, unlimited model; you open the link and click *Run Unlimited*.

PLUGIN	human-skills · v0.7.1 · nine skills
AUDIENCE	Human design & creative team
PROVIDERS	Magnific (plan credits / zero-credit Spaces) · Higgsfield (paid)
TIME TO READ	8 minutes

PART 1

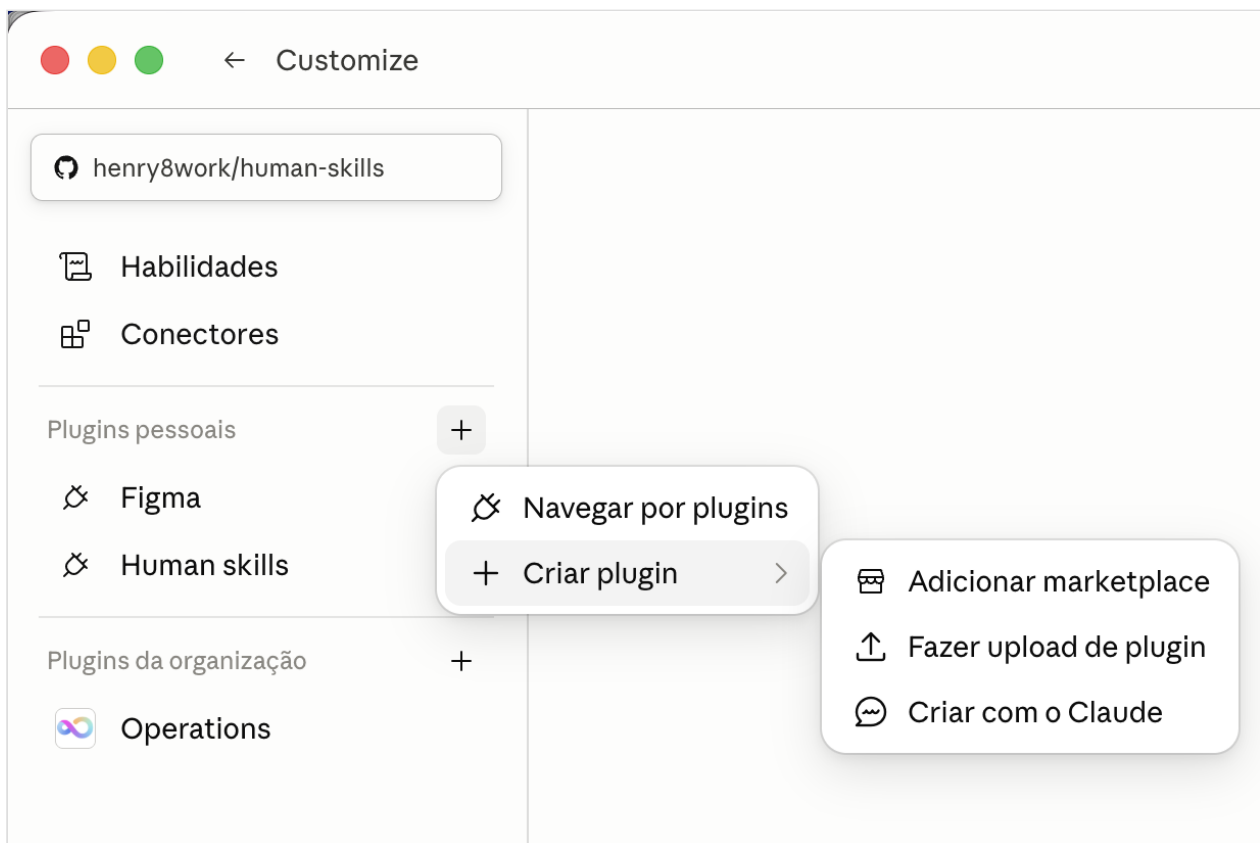

Install the plugin

Human Skills ships as a **single file** — `human-skills-v0.7.1.plugin`. The nine skills — *human-setup*, *human-image*, *human-product-ad*, *human-cinematic*, *human-dna*, *human-carrossel*, *human-social*, *human-team*, *human-motion* — all live **inside it**. You install the plugin once and every skill comes with it. You never call a skill by name: you describe what you want — *"make me a key visual"*, *"turn this product photo into a cinematic ad"*, *"build a brand DNA"* — and Claude routes to the right one automatically.

THE EASY WAY — UPLOAD THE FILE IN CUSTOMIZE

No terminal, no GitHub. If a teammate sent you the `.plugin` file, just upload it:

- 01 Open **Customize** in the Claude desktop app.
- 02 Next to **Plugins pessoais**, click **+** → **Criar plugin** → **Fazer upload de plugin**.
- 03 Pick the `human-skills-v0.7.1.plugin` file. **Done** — "Human skills" shows up under your plugins, with all nine skills inside.

Customize → Plugins pessoais + → Criar plugin → Fazer upload de plugin.

WHERE THE FILE COMES FROM

Someone on the team shares the `.plugin` with you (Slack, Drive, AirDrop) — that's the whole hand-off. To build a fresh one from the repo, run `./build-plugin.sh`; it writes `dist/human-skills-v0.7.1.plugin`, ready to upload.

PREREQUISITES (ONLY WHEN A SKILL NEEDS THEM)

- **At least one render provider** — Magnific or Higgsfield (Part 2). Install the plugin first, connect a provider later; every skill checks and guides you if one is missing.
- **Node.js LTS + npm** — for the Higgsfield CLI, human-motion (Remotion) and human-team helpers.
- **Python 3** — for the human-social and human-dna helper scripts.

ADVANCED — FOR TEAMMATES WHO WANT ONE-COMMAND UPDATES

Optional, terminal-based. A GitHub marketplace lets the whole team install and update from one source:

```
/plugin marketplace add henry8work/human-skills  
/plugin install human-skills@human-skills  
# later: /plugin marketplace update human-skills && /reload-plugins
```

For local development you can also start the CLI with `claude --plugin-dir /path/to/plugin-folder` (loads for that session only). Most people don't need either — the upload above is enough.

PART 2

The render setup — three paths

Every skill that makes an image asks **one question before rendering**: which render path to use. It never assumes — you choose per job. Here are the three, and how to set each one up.

PATH	COST	WHAT IT IS & WHEN TO USE IT
1. Magnific MCP direct	Plan credits (~75 / image at 1k)	Claude generates straight from chat through the Magnific MCP. Fast, no clicks. Best for one-offs and quick iterations. Uses the credits already included in your Magnific subscription — never pay-per-use money.
2. Magnific Hybrid — Run Unlimited	Zero credits	Claude builds a Space and pre-fills the prompts; you open the link and click <i>Run Unlimited</i> . Best for batches and zero spend. This is the flow in Part 3.
3. Higgsfield	Paid (your Higgsfield credits)	Your own Higgsfield account via its CLI. Needed for Higgsfield-exclusive models and some video. The carousel and product-ad pipelines ship with Higgsfield scripts.

SET UP MAGNIFIC (PATHS 1 & 2) — THE OFFICIAL MCP

Magnific connects through its official MCP server with a one-time browser login. `mcp-remote` is the bridge that always works (including locked-down enterprise plans):

```
# 1. install the bridge
npm install -g mcp-remote

# 2. register the server (user scope, every project)
claude mcp add --scope user magnific-mcp -- mcp-remote https://mcp.magnific.com

# 3. trigger the one-time OAuth login (browser opens, sign in, approve)
mcp-remote https://mcp.magnific.com

# 4. verify
claude mcp list # magnific-mcp ... Connected
```

Each teammate connects their own Magnific account and spends their own plan credits. In a new session, `account_balance` confirms the plan and remaining credits.

SET UP HIGGSFIELD (PATH 3) — THE CLI

```
npm install -g @higgsfield/cli
higgsfield auth login # browser/device login
higgsfield account status # verify (there is no "whoami")
```

"What about an API key?" The skills deliberately route through the Magnific *MCP* (your plan credits) and the Higgsfield *CLI* (your account credits) — never a raw, pay-per-use API. That's the whole point: you spend the subscription you already pay for, or nothing at all via Run Unlimited. There's no separate API billing to manage.

MODEL NAMES (SO THE WRONG ONE NEVER GETS PICKED)

MODEL	MAGNIFIC (PARAM IS MODE)	HIGGSFIELD CLI SLUG
Nano Banana 2 — default image	imagen-nano-banana-2-flash	nano_banana_flash
Nano Banana Pro — max fidelity	imagen-nano-banana-2	nano_banana_2
GPT Image 2 — text/layout, carousels	gpt-2	gpt_image_2
Kling — video	kling-25 / kling-30	kling3_0

Naming trap: on Higgsfield, nano_banana_2 is "Nano Banana Pro" and nano_banana_flash is "Nano Banana 2". On Magnific the parameter is always mode, never model.

PART 3

The Spaces flow — you just press play

This is path 2 (Magnific Hybrid, "Run Unlimited") in detail — the way to generate at **zero credits**. The split is simple: Claude does all the thinking and setup, you do one click.

HOW IT WORKS

- 01 You describe the job and pick "Hybrid / Run Unlimited" when asked the render path.
- 02 Claude builds a Magnific Space and pre-fills one generator node per image — each loaded with the prompt it wrote, the aspect ratio, and a **free, unlimited-eligible model** (Nano Banana 2 at 1k for images; a free-eligible model for video).
- 03 Claude shares the Space link (webUrl) with you.
- 04 You open the link in the browser, select the nodes, and click **Run Unlimited**. This costs **zero credits**.
- 05 Claude collects the finished images back from the Space and continues the pipeline — assembling the carousel, the ad, the social pieces, whatever the skill was doing.

In this flow the model is **always pinned to a free, unlimited option** — Nano Banana 2 at 1k for stills, and the free-eligible models for video. You never spend credits, and you never write a prompt. Run Unlimited eligibility depends on your Magnific plan.

DIRECT FROM CLAUDE VS. THE SPACES FLOW

	MCP DIRECT (PATH 1)	SPACES / RUN UNLIMITED (PATH 2)
Who clicks	Nobody — Claude renders in chat	You click Run Unlimited once in the browser
Cost	Plan credits (~75/image)	Zero credits
Free models	Not available — direct can't run the free unlimited models	Yes — that's the whole point
Best for	One-offs, urgency, a single quick image	Batches, carousels, anything where you don't want to spend

Both are real options and you can mix them: a quick test direct from Claude (a few credits), then the full batch through Spaces at zero cost. The rule of thumb — **direct when it's one image and you're in a hurry; Spaces when it's a batch or you want to spend nothing.**

WHAT TO SAY TO CLAUDE

"Use the Hybrid Run Unlimited flow — set up the Space with Nano Banana 2 at 1k, send me the link, I'll hit play."

HONEST CALL

Run Unlimited is a browser feature — it can't be triggered through the MCP, which is exactly why the flow needs your one click. If your Magnific plan doesn't include unlimited on a given model, that model simply won't be free; Claude will tell you and offer the direct path or Higgsfield instead. Everything else — the prompts, the Space, collecting the results — is automated.
